Invertebrates in the Classroom: Summary

Aquatic invertebrates are hugely important in our rivers. Not only can they tell us how clean our rivers are, but they are also a vital food source for many different organisms including fish, birds and bats – providing links between aquatic and terrestrial ecosystems. They also lend themselves very well to education though, providing a great basis on which to learn about our river's ecosystems.

The Tweed Foundation's "Invertebrates in the Classroom" is a fun, interactive project aimed at primary school age groups. The project consists of 3 sessions lasting over 3 - 4 weeks in which classes will learn about invertebrates, their life cycles and why they are so important. Classes will visit their local river to sample for invertebrates before taking some back to look after in their classroom aquaria and observe their metamorphosis from juvenile to adult stage.

Throughout the project the children will monitor the invertebrates in their aquaria, making sure they have a good oxygen supply as well as monitoring and regulating the water temperature. They will also look out for when the juveniles hatch into adult invertebrates, observing metamorphosis.

All the activities throughout the project have been matched up to both the Scottish and English education curriculums. The 3 sessions are as follows.

Suitable for: Levels 1 & 2, KS 1 & 2

Session 1: Introduction to Invertebrates

In this session the class will be introduced to the world of aquatic invertebrates, learning about their diversity, life cycles and why they are so important in our rivers. They will then prepare for keeping invertebrates in their classroom by creating their own aquaria.

Curriculum areas covered: Science, Design and Technology, Social Science/Geography

Session 2: Sampling for Invertebrates

Having set up their aquaria, this session is when the classes collect their invertebrates. Classes will visit their local river to carry out kick sampling (a method for catching invertebrates). Having collected their samples, the class will then use biological keys to identify the invertebrates they have caught and then use this information to carry out a pollution score test for the river. Once completed, invertebrates will then be selected and taken back to the aquaria in the classroom.

Curriculum areas covered: Science, Health and Wellbeing, Maths

Session 3: Releasing the Invertebrates

Having monitored the invertebrates throughout their time in the classroom and (hopefully) seen them undergo metamorphosis from juveniles to adults, the class will then release them back into the wild. The class will take another trip to the river to do this, as well as to recap on the project and look out for other organisms living in or around the river, linking them back to invertebrates.

Curriculum areas covered: Science

Invertebrates in the Classroom can be run in either the summer or autumn term of the school calendar. Two of the sessions involve trips to the river but this is dependent on weather conditions, river levels and proximity to a safe, suitable location on the river. The project leader will keep in contact with teachers to monitor whether these trips to the river will be possible, but if for any reason they are not, then invertebrate samples can also be taken into the classroom.

If you would like to take part in Invertebrates in the Classroom, or even just like to find out a bit more about the project, then please do get in touch with the Tweed Foundation.
